

Air Methods

# Burns

## Air Methods Corporation Community Based Services

### Objectives

- List burns by the type of causative factors (chemicals, exposures, electrical, etc.)
- Identify treatment modalities, including airway management, pain control, and fluid resuscitation
- Calculate burn percentages, and size estimation
- List transport modalities and level of care

### Authored by:

Rachel Kubalek, RN, CFRN  
Teather Campbell, RN, CFRN

### Burns-Introduction

- Epidemiology
- Initial management
- Treatment
- Associated Injuries

<https://www.burns.westpass.com/2014/03/14/the-almost-tragedy-of-the-origins-of-the-particle-by-typer/>

### Epidemiology

0.13 facts from American Burn Association:  
Burn injuries account for an estimated 450,000 annual emergency department (ED) visits per year  
45,000 require hospitalization  
Approximately 60% of these patients are hospitalized at one of the 125 specialized burn treatment centers in the United States

### Epidemiology

3400 deaths per year are related to fire/burn/and smoke inhalation (nation wide).  
Nebraska has St Elizabeth burn center that is accredited by the American Burn Center.  
96.6% of admissions to burn centers from 2003-2012 survive.

## Epidemiology

With temps > 120 degrees Fahrenheit, it takes only 3 seconds to burn a child's skin severely enough to require surgery

<http://www.burninjury.com/burns/148/child-burned-by-coffee-144629/>

## Mechanics and Causative Factors

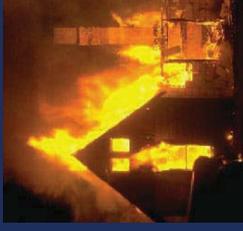

- Thermal
  - Flame
  - Scald
  - Flash
  - Contact
- Chemical
- Radiation
- Electricity
- Lightning
- Frostbite

<http://www.docuimages.com/burns/148/child-burned-by-coffee-144629/>

## Thermal: Flame

Most Common

<http://threewordfireamer.com/2011/12/01/when-the-house-burns-down/>

## Thermal Scald

Second most common burn  
Highest in the pediatric population  
Immersion burns involve deeper tissue structures  
Consider abuse

[http://www.medic.com/qa/qaentry/vol\\_11/tem\\_387e\\_45131312.htm](http://www.medic.com/qa/qaentry/vol_11/tem_387e_45131312.htm)

## Flash Burns

[http://burnsurgery.blogspot.com/2010/flash-burns-thermal-cracker\\_18.html](http://burnsurgery.blogspot.com/2010/flash-burns-thermal-cracker_18.html)

<http://www.amsworld.com/article/0639933/burn-care>

## Contact Burns

Liquid  
Semi-liquid, (Tar, solvents, water, etc.)  
Objects

[http://burnsurgery.blogspot.com/chemical\\_burns.htm](http://burnsurgery.blogspot.com/chemical_burns.htm)

<http://www.burnviews.com/injured.html>

## Electrical Burns

Damage is related  
Amount of tissue conducting the  
current

- Flow of electricity which is:
  - Amperage (flow of current)
  - Voltage (amount of current)
  - Resistance or conductivity of fluids and tissue
- AC (Alternating current) has a higher incidence of myocardial fibrillation than DC (Direct current)

<https://www.stanford.edu/meded/meded/2013/05/09/050913/electricalburn.html>

<http://www.dominion.edu.uk/wordsandpictures/multimedia/electricalburns/>

## Electrical Burns

Entrance Wound

High resistance of skin transforms electrical energy into heat, which produces burns around the entrance point (dark spot in center of wound)

<http://burnsurgery.blogspot.com/2013/10/electrical-contact-burns-signs-exposed.html>

## Alternating Current (AC)

Low voltage AC electrocution

- three times more dangerous than DC current at the same voltage

With AC electrocution

- continuous muscle contractions may occur
- since the muscle fibers are stimulated at between 40 to 110 times per second.

## Alternating Current (AC)

Voltage and type of current

- United States and Canada is 110V & some 220V
- Larger household, industrial applications such as shops, manufacturing plants, etc., and center pivot irrigation systems may have as high as 440 V

## Alternating Current (AC)

- Power lines and electrical transformers constitute high-voltage energies and involve over 600 volts
- By definition, high-tension injuries involve currents of greater than 1000 volts

## Example of AC Current

Contact electrical burns,

- 120-V alternating current.

The right knee was the energized side, and the left was ground.

- These are contact burns and are difficult to distinguish from thermal burns.

[https://www.cchh.org/STC/electricalconstruction/electrical\\_injuries/burn\\_examples.html](https://www.cchh.org/STC/electricalconstruction/electrical_injuries/burn_examples.html)

## Direct Current

High voltage direct current (DC) electrocution tends to cause a single muscle contraction

- throwing its victim from the source
- More blunt trauma

## Direct Current

Direct current electrocution can also cause cardiac dysrhythmias

- dependent on the phase of the cardiac cycle

## Exit Wound

Current flows through the body from the entrance point, until finally exiting where there is a grounding source

This foot suffered massive internal injuries, which weren't readily visible, and had to be amputated a few days later

<https://www.osha.gov/DC-ENR/OSHA-CONSTRUCTION/OSHA-CONSTRUCTION-ACCIDENTS/OSHA-CONSTRUCTION-ACCIDENTS-2014>

## Arch Burns

- This man was near a power box when an electrical explosion occurred.
- Though he did not touch the box
  - electricity arced through the air and entered his body.
  - The current was drawn to his armpits because perspiration is very conductive

<https://www.osha.gov/DC-ENR/OSHA-CONSTRUCTION/OSHA-CONSTRUCTION-ACCIDENTS/OSHA-CONSTRUCTION-ACCIDENTS-2014>

## Thermal Contact Burns

Current exited this man at his knees, catching his clothing on fire and burning his upper leg

## Internal Injuries

This worker was energized through a tool he was holding. The entrance wound and thermal burns from the overheated tool are noted...

<https://www.osha.gov/DC-ENR/OSHA-CONSTRUCTION/OSHA-CONSTRUCTION-ACCIDENTS/OSHA-CONSTRUCTION-ACCIDENTS-2014>

## Internal Injuries: Same Hand

Same hand a few days later, when massive subcutaneous tissue damage had caused severe swelling (swelling usually peaks 24-72 hours after electrical shock)

[https://www.dhs.gov/sites/default/files/publications/16\\_0001\\_electrical\\_injuries\\_burns\\_061616.html](https://www.dhs.gov/sites/default/files/publications/16_0001_electrical_injuries_burns_061616.html)

## Involuntary Muscle Contraction

This worker fell and grabbed a power line to catch himself.

- resulting electric shock mummified his first two fingers, which had to be removed.
- acute angle of the wrist was caused by burning of the tendons, which contracted, drawing the hand with them.

## Lightning Injuries

Second most frequent cause of storm related deaths.

- Usually causes superficial burns, with deep tissue penetration from the current.
- May cause asystole or fibrillation.
- Short or long term hearing loss or changes.
- Vision changes or early cataracts.

## Mechanisms of Injury

Lightning injury-5 basic mechanisms

- Direct strike
- Flash discharge (splash)
- Contact
- Ground current (step voltage)
- Blunt trauma

## Direct Lightning Strikes

Outside, hiking, by a tall object, etc.

Carrying metal objects

Metal worm in the hair (hairpin)

- Increases the chances of a direct strike compared with a metal object worn lower on the body
- Associated with high morbidity because they frequently involve the head.
- May cause hearing loss, cataracts, arthritis, etc.

## Flash Discharge

Struck by a flash discharge or side impact from another struck object

Splash injury also occurs from person to person when several people are standing close together

## Pathophysiology

Lightning injury differs from commercial high-voltage electric injury

- Brief Duration
- Direct Current
- High temperature
- Sonic waves
- Flash burns
- Co-morbid trauma

## Pathophysiology

As lightning follows the shortest route between contact points of the human body

- it may involve vital structures in its path.
- Almost every organ system is vulnerable.
- A wide variety of complications can result from damage to these organ systems.

## Chemical Burns

Safety for you and your colleagues  
Injury dependent on the concentration and the duration of the exposure

### Acid or Alkali

- Irrigate strong acids or alkali exposures for at least 30-60 minutes
- Continuous irrigation if eye is exposed to chemicals

## Chemical Burn- Alkali

<http://baschark.com/chemicalburns-in-eyes.htm>

## Chemical Burn-Acid

<http://img.phila.de/vastar.com/ur/Theoretical-approach-alkali-burn-22818760>

## Radiation

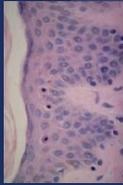

Sunburn

Radiation therapy

## Sunburn Damage

Within 2 hours after UV exposure, damage to epidermal skin cells is seen.

## Sun Protection

SPF	Approximate % of UVB rays blocked
2	10%
4	17%
6	23%
8	28%
10	32%
15	40%
20	47%
30	54%
50	68%
75	78%
100	84%

http://www.who.int/mediacentre/factsheets/fs204/en/index.html

http://www.who.int/mediacentre/factsheets/fs204/en/index.html

## Frostbite

As the tissue cools, ice crystals form, cell dehydration follows with cell death  
Rewarm with 40 degree C water  
Do not rub or use any friction

## Pathophysiology

Cardiovascular

Renal

Metabolism

Immune System

Gastrointestinal

https://www.interest.com/par/33415512462369563/

## Scene/ER Safety

## Primary Assessment

Early & aggressive airway management including c-spine protection if necessary

## Breathing

Usually involves the upper airway above the glottis  
 May have a delayed onset  
 Chemical involvement may cause lower airway damage  
 Carbon Monoxide

## Circulation

2 large bore IVs with LR  
 Consensus formula (formerly Parkland burn formula)  
 Treat for all injuries  
 Monitor UOP  
 — Adults > 30-50 mls/hr  
 — Pediatrics 1-2 mls/kg/hr

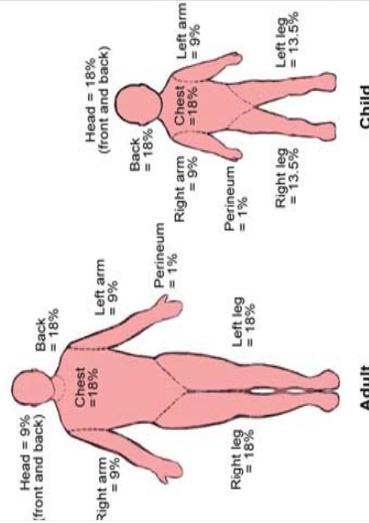

Lund and Browder Burn Chart

Area Burned	Age In Years		Percentage of Total Body Surface
	1 to 4	5 to 14	
Head	10	17	13
Neck	2	2	2
Anterior Trunk	13	13	13
Posterior Trunk	13	13	13
Right Arm	2.5	2.5	2.5
Right Forearm	1	1	1
Right Hand	1	1	1
Right Upper Arm	4	4	4
Left Upper Arm	4	4	4
Left Forearm	3	3	3
Left Hand	3	3	3
Left Lower Arm	3	3	3
Right Hand	2.5	2.5	2.5
Right Forearm	2.5	2.5	2.5
Right Upper Arm	2.5	2.5	2.5
Right Thigh	5.5	6.5	6.5
Right Lower Leg	5.5	6.5	6.5
Right Foot	5	5	5
Left Lower Leg	5	5	5
Left Foot	3.5	3.5	3.5
Left Lower Arm	3.5	3.5	3.5
Left Foot	3.5	3.5	3.5

## Lets Calculate a Percentage

[http://study.dread.com/index.php?option=com\\_content&view=full&Itemid=511561](http://study.dread.com/index.php?option=com_content&view=full&Itemid=511561)

## Fluid Calculation

According to Advanced Burn Life Support(2011)  
 Consensus Formula:  
 — 2 ml per kg X percentage of burn  
 — Give the first half over the first 8 hours from onset of burn  
 — Give the second half over the remaining 16 hours

## Pediatric Calculation

9 month old, 10 kg patient brought to ER

- second and third degree burns:
  - to chest, abdomen, scrotal area, upper right arm and palm of right hand.

<http://www.doh.ny.gov/health/2007>

<http://medscape.com/viewarticle/93118>

## Pediatric Fluid Calculation

Per Advanced Burn Life Support (ABLS):

- > Children:  $2-4 \text{ ml LR} \times \text{kg body weight} \times \% \text{BSA burn}$
- > Half administered in the first 8 hours post burn.
- > The remaining half the next 16 hours

<http://www.healthcare.wa.gov/Healthcare/ABLS.htm>

## Pediatric Urinary Output

The fluid infusion rate should be increased or decreased by one-third

- > if the urinary output falls below or exceeds the desired level by more than one-third for two to three hours. (Children  $<30 \text{ kg}$  UOP goal =  $1 \text{ ml/kg/hr}$ )

<http://paramedics.ca/paramedics/abls/>

## Infant Fluid Calculation

Infants  $< 12$  months and young children:  
Fluid with 5% dextrose at a maintenance rate in addition to the resuscitation fluid noted above.

## Pediatric Fluid Calculation (cont.)

2 ml per kg X % of burn.

Pt weight is 10kg.

$2 \text{ ml} \times 10 \times 20.5 = 420 \text{ ml}$  over 24 hours.

210 ml is given in the first 8 hours from the onset of burn (run at 26 ml/hr)

» ABLS 2011

## Disability

Neuro assessment before and after sedation and paralytics.

Assess for circumferential burns. Monitor pulses, motor and sensation distal to the injury.

Monitor for compartment syndrome

## Pain Management

Aggressively treat and manage pain  
If the patient is not intubated, administer IV opioids in small boluses and titrate to effect.  
Monitor closely for respiratory depression.  
Anxiolytics such as Ativan may be necessary.  
Consider intubation if pain control is inadequate.

## Pain Management (cont.)

## Exposure

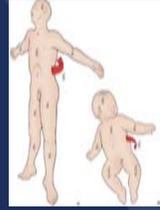

After the burning process is stopped, remove wet clothes, blankets, etc  
Cover with clean dry sheets or blankets (They do not need to be sterile). Avoid wet dressings as they can cause hypothermia.

Maintain temperature, avoid hypothermia

## Secondary Survey

Check for associated trauma.  
Estimate burn size  
Pt's palm=approx. 1% of burned area

[www.amboss.com/US/meds/amboss/amboss.html](http://www.amboss.com/US/meds/amboss/amboss.html)

<http://www.cdc.gov/od/ocdc/pubs/ocdc.htm>

## If in Doubt

CALL YOUR BURN CENTER

<http://www.jaistat.com/news/health/burn-center-jobs-stressful-rewarding-4660416-1600071620.html>

## Special Considerations

Pediatric Population

<http://www.dailymail.co.uk/news/US/2389727/Three-month-old-baby-gets-safes-home/fig-burns-spontaneously-bursting-flames-burns-home.html>

## Brand Burns

The imprint of a hot object:  
– Curling iron or flat iron

<http://www.dccprburns.gov/our-history/brand-burns>  
for a detailed description of brand burns, visit <http://www.dccprburns.gov/our-history/brand-burns>

## Cigarette Burns

Cigarette burns are circular,  
– 8 to 10 mm in diameter, and of uniform depth  
These burns may be difficult to distinguish from impetigo  
– But the latter involves superficial skin layers and occurs  
in crops

<http://www.fda.gov/oc/ohrt/ohrt030104.html>

## Cigarette Burns

Cigarette burns usually are third-degree, deep, and relatively painless:

- Occur on the face or on the dorsa of the hands or feet.
- Impetigo heals cleanly with antibiotic therapy
- Whereas cigarette burns heal slowly and leave scars

## Cigarette vs. Impetigo

<http://www.dccprburns.gov/our-history/brand-burns>

<http://www.dccprburns.gov/our-history/brand-burns>

## Immersion burns

Immersion burns usually are seen on the buttocks or legs, or in a stocking or glove distribution on the extremities

Uniform depth, with a sharp line of demarcation between burned and normal skin

## Transfer Criteria

Transfer to a burn center:

- Partial thickness burns > 10% TBSA
- Burns to face, hands, feet, genitals, perineum or joints
- Any 3rd degree burns
- Electrical
- Chemical
- Inhalation

## Summary

- Stop the burning process
- Aggressive airway management
- Adequate fluid resuscitation
- Maintain warmth after exposure
- Analgesia
- Burns are distracting, look for other injuries

## Questions?
